

ISO 6778:1984, Water quality - Determination of ammonium - Potentiometric method

Specifies a procedure using an ammonia-sensing membrane probe for raw and waste water and sewage. The procedure is applicable to ammonium nitrogen concentration of up to 50 mg/l. The limit of detection is defined as the limit of Nernstian response under the conditions specified and has a value corresponding to approximately 0,2 mg/l. This title may contain less than 24 pages of technical content.
