

## Compost, Leafmould and Wormeries - a Guide to Home Composting

With our landfill sites bursting and our carbon footprint increasing our reasons for home composting have never been greater. Not only does it reduce the amount of waste sent to landfill, it reduces the environmental impact of getting that waste to the landfill. Composting is part of nature's biological cycle of growth and decay. Energy from the sun, carbon dioxide from the air, and nutrients from water and soil make our plants grow. When the plants die and decompose the nutrients go back into the soil, and carbon dioxide back into the air and what remains from this process - the humus provides soil with organic matter which in turn improves the soils and so the cycle continues. Organic gardeners have long been embracing the idea of composting and now with the rise in interest in reducing waste and our carbon footprint it is becoming more and more popular. There are various methods of turning your organic waste into compost and this guide aims to help you decide the best method or combination of methods to suit you.
